

Part II

1. What problem does your product website solve or address?

My product addresses the problem of there not being a website/application that is dedicated to giving television fans a place to go when they are wondering what to watch, want to see what everyone else is watching, want to read or write reviews, or talk to others about a certain show.

2. What is your product idea? How does your website support this idea and help solve the problem?

My product is an application/website that gives a place for all fans and people interested in television shows a place to go when they want to find or share anything about television shows. My website would include ways of finding good recommendations, sharing recommendations, checking what your friends are watching, making and reading reviews, discussing shows, and much more.

3. What type of website are you building? (i.e., e-commerce, brochure, portfolio, media, nonprofit, etc.)

This would be categorized as a “social-media like” and entertainment website.

4. What is your mission statement? Summarize what your product does, who it's for, and why it matters.

The mission statement of my website is giving avid and casual television viewers a place to go when they have any questions on what to watch or want to delve into communities consisting of other fans of the same shows. They can connect with real life friends and online friends to discuss interests and shows they are or have already watched. The purpose of this is to bring people with a huge common interest together to connect in this large format, and also be able to create subcommunities where they can connect to. Anyone can use this website, whether they are diehard television fans, casual watchers, or have even a slight interest in television.

1. Who is the primary audience that your product is trying to reach? Include the following details about your target audience:

The primary audience I am trying to reach is open to any gender and any race. The age range would mostly be towards adults 15-35 years old as I think this age group corresponds to who is most likely paying the most attention to what they watch to the point where they would either want to share or connect with others online regarding the shows. However, this does not mean that people below or above this range would not be suited to use the website, they definitely would be capable. To gauge the possible gender distribution I looked at a similar website, *Letterboxd*, which is primarily a movie and cinema focused application and their gender distribution was around 56% male audiences and 44% female audiences. It would be logical that the distribution for a similar television show focused website to float around that distribution as well. Visitors from all over the world can visit the website, but to see what the most common places from where people would visit I looked up what countries spend the most time watching television. My research shows that the United States of America, Japan, South Korea, Italy, France, and Russia spend some of the most time in the world watching television shows. Of course the types of television and how invested they are varies both from country to country and from person to person. More than likely the visitors would live in more urban and suburban areas rather than rural areas as those tend to spend more time watching television.

The average income of visitors does not necessarily have a specific range as people from all income levels spend time watching television. However, the more comfortable their living status is, the more likely they would be able to afford to spend time invested in TV shows. They would also most likely have at least a high school education level. Both married, unmarried, and people with children can find use of this website. The job they have does not restrict them from finding use in the website, but the amount of time they have to dedicate to their job might restrict them from using all the features, but could also boost the usefulness of other tools the website provides. I would say working 20-40 hours a week would still allow them to find complete use of the website but once they start spending more time out their week, the less time they spend watching television.

For this website, visiting it everyday is not necessary. Once every week or two weeks can be enough to check up on shows you've either watched or missed, and also connect with others in your community. Access to this website could be accessed easily through the use of mobile devices or personal computers.

2. Create a chart with at least three fictional visitors from your target audience. This chart should include at least their name, sex, age, location, occupation, income and web use. You can create this chart manually or with AI tools like [ChatGPT](#).

	Person One	Person Two	Person Three	Person 4
Name	Tyler Johnson	Sophia Martinez	Robert Draft	Derrick Wilson
Sex	Male	Female	Male	Male
Age	24	27	35	33
Location	Austin, Texas	Chicago, Illinois	Denver, Colorado	San Francisco, California
Occupation	Marketing Assistant	Graphic Designer	High School Teacher	Software Engineer
Income	\$42,000 / year	\$63,000 / year	\$58,000 / year	\$125,000 / year
Web Use	5–7 hours per day; frequently uses streaming services, YouTube, TikTok, and social media	6–9 hours per day; heavily uses social media, streaming platforms, fan communities, and entertainment websites	4–5 hours per day; primarily uses Facebook, YouTube, streaming services, and news websites	3–5 hours per day; uses the web for work, entertainment, news, and social media
Reason For Visiting	Tyler loves binge-watching entire seasons over a weekend. He uses the site to keep track of shows he has completed, rate them, and find similar series. He enjoys comparing his ratings with other users and reading reviews after finishing a season.	Sophia is extremely passionate about certain TV series and enjoys discussing characters, storylines, and theories with other fans. She uses the site to post detailed reviews, rate individual seasons, and follow other fans who share her interests.	Robert enjoys both classic television and newer series. He wants a place to keep track of what he has watched and share his opinions with other viewers. He particularly enjoys comparing older shows with modern series and discovering shows recommended by other users.	Derrick doesn't have much free time, so he wants to quickly find high-quality shows that match his interests. He uses community ratings, reviews, and recommendations to decide what to watch. He also enjoys keeping a profile of the shows he has watched and sharing ratings with friends.

Part III

A. Website Requirements

By addressing the questions below, you'll gain valuable insights into how to design a website that meets your goals and expectations.

1. Purpose & Goals

Answer the following questions in your document:

- **What is the primary goal of your website (i.e., promote a service, sell a product, educate users, raise awareness, etc.)?**

The primary goal of my website is to use something that already has an existing audience by appealing to their interest and through their engagement earn money through ad revenue and a paid subscription.

- **What is the most important action you want users to take on your site (i.e., sign up, purchase, read articles, submit a form, etc.)?**

The most important action I would say would be user engagement in rating shows and writing reviews. That information would be used to better push certain shows to people. This could mean pushing shows that are generally well received by everyone to more general audiences, or only pushing shows that a specific genre fan group is interested in to that specific group. When it comes to monetization the most important action would be time spent on the app and keep them on longer in order to run more ads.

2. Content & Features

Answer the following questions in your document:

- **What content and features are essential to help users achieve their goals? List critical pages and features (i.e., About, Contact Form, Product Gallery, FAQs, Reviews, etc.).**

Important help features like an About, Tutorial/FAQs, and Contact Form would be very beneficial. When it comes to separate pages on the website I think a homepage, profile page, tv show search page, reviews page, and fandom/community page would be useful for the users.

- **What will your homepage highlight? Think about the first impression and what visitors need to see right away.**

In my opinion, the homepage should highlight the user's watchlist, popular shows that are currently trending, what their friends are watching, and show any updates on their profile.

3. Look & Feel

Answer the following questions in your document:

- **Do you have examples of websites that inspire your design? List 1–2 examples and what you like about them (i.e., layout, colors, interactivity, etc.).**

A big inspiration on my website is the website <https://letterboxd.com/>. It is a movie/cinema focused website. My favorite part of the website is the amount of interactivity there is available. Whether it is reviews, rating, and viewing watchlists, the website does a good job of providing a plethora of tools for movie fans. I envision the same for my website with the addition of more direct communication between the people on the websites.

- **How would you describe the overall style of your site (i.e., modern, bold, minimalist, playful, professional, etc.)?**

I envision my website with a very modern style. I think the style pairs well with the theme of television.

- **Do you have preferences for color, fonts, or imagery? If not, what mood or personality do you want the site to convey?**

I think utilizing the colors from the old television colorbar would go well with the modern look and theme of television shows. Those colors are shown below. (White, Yellow, Teal, Green, Purple, Red, and Blue)

B. Design & Prototyping

In this final section, you'll bring together your ideas and planning to shape the visual direction of your product website. You'll document your design choices and development strategy through diagrams, sketches, and visuals that guide your build process.

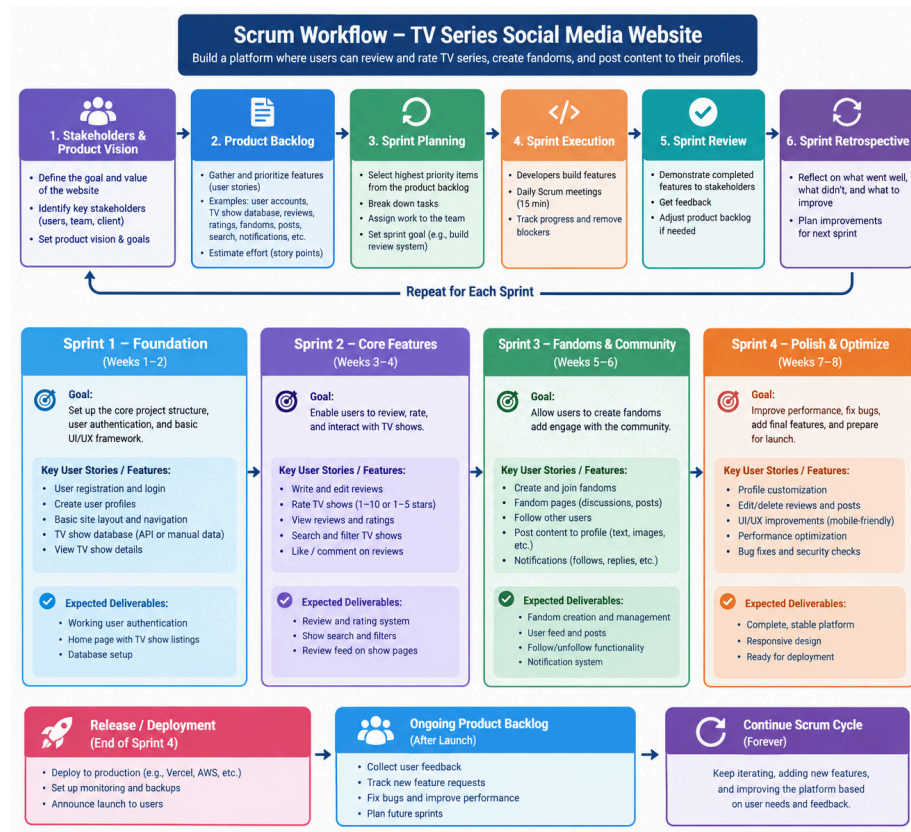

1. SDLC Approach & Timeline

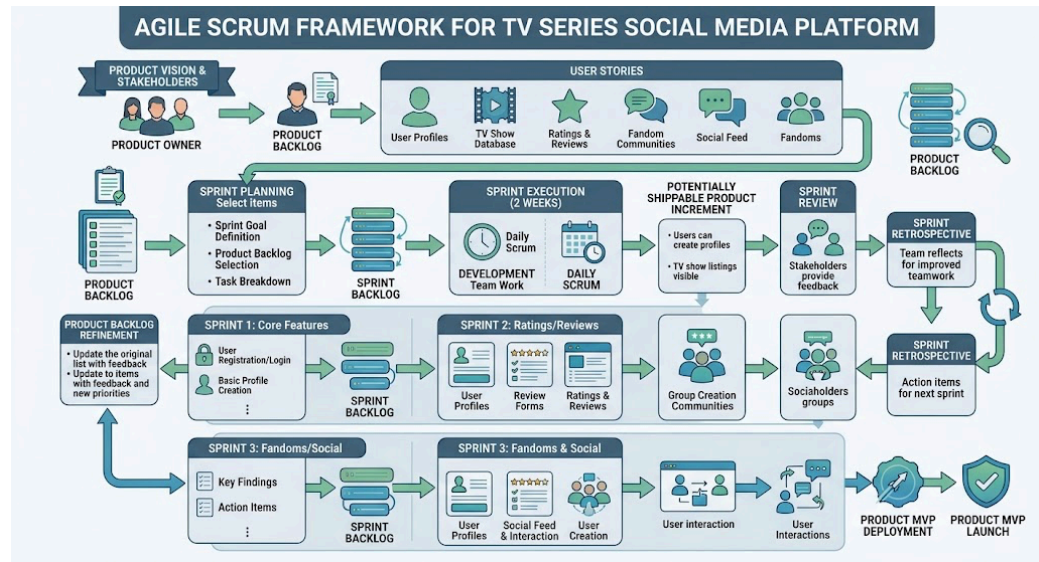

In your answer document, outline how you plan to build your website using the SDLC. Your plan should include:

- The SDLC model you've chosen (Waterfall, Agile, Scrum, etc.).
- A clear timeline of phases and milestones.
- A visual representation of your timeline (e.g., Gantt chart, flowchart, or detailed bullet list).

You may create this manually or with AI tools ([ChatGPT](#), [Gantt Chart AI](#)).

I have chosen Scrum.

2. Original Logo

Design a logo for your product website that visually captures your brand identity. Your logo must include:

- The name of your product.
- An image, icon, or design that represents your product.
- A transparent background (export as PNG).

Use free tools like [Pixlr X](#) to create your logo. You can check out a [video tutorial](#) or [written tutorial](#) on how to create a logo in Pixlr X.

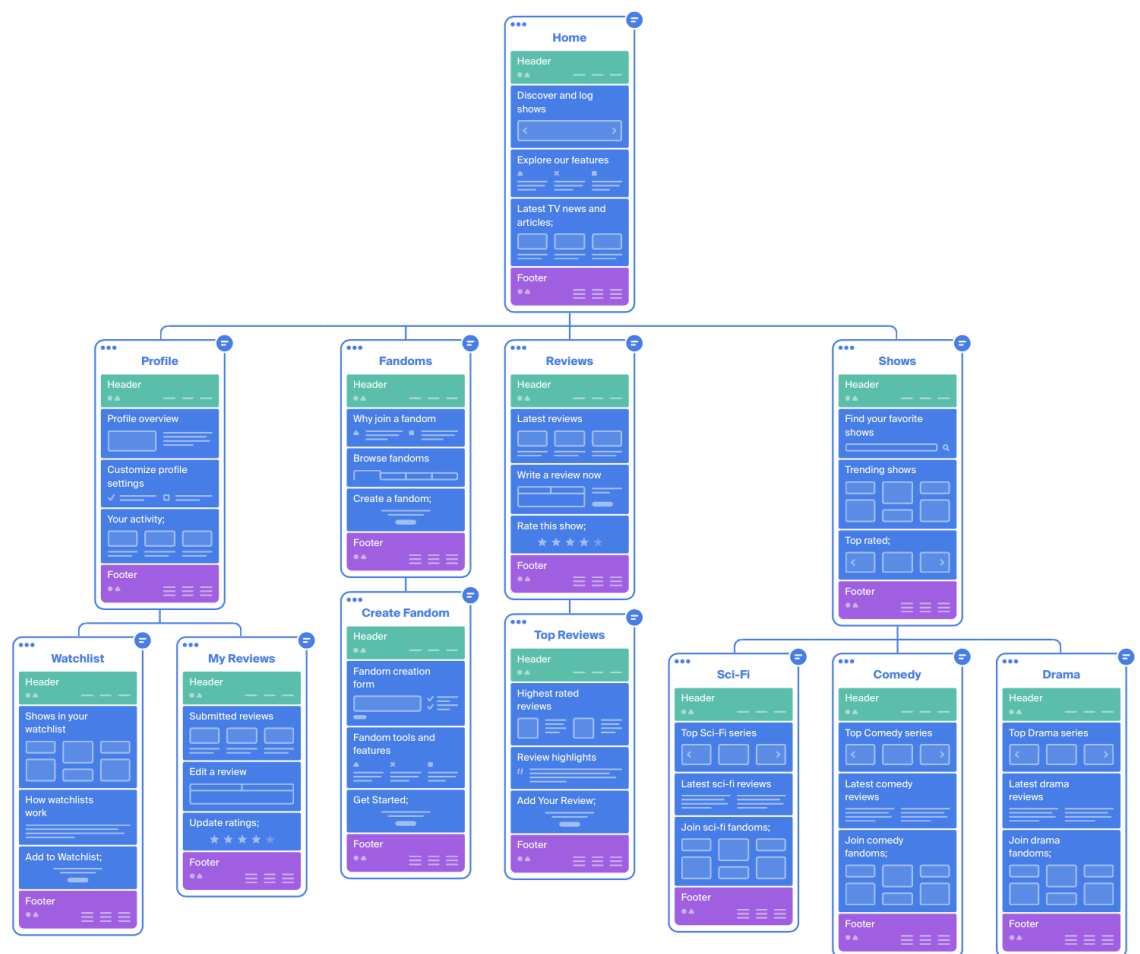

YourTV

3. Site Map

Create a site map that shows how your site will be structured and how users will navigate between pages. Your site map should:

- Illustrate the structure and grouping of your web pages.
- Clearly shows how users will navigate between the pages.
- Reflect any feedback you received from your peers during the lab.

You can create your site map manually on paper, using draw.io or with AI tools ([Slickplan](https://Slickplan.com), Octopus.do).

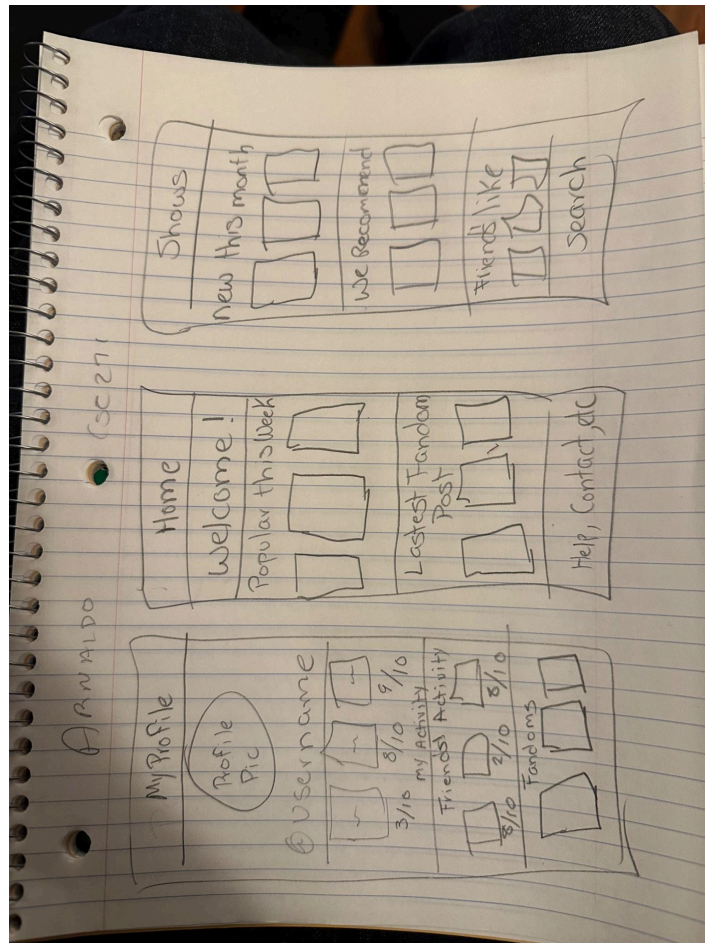

4. Wireframes

Design wireframes for your homepage and at least two other core pages. Your wireframes should:

- Clearly sketch where key information and interactive elements will be located. This must include placement of navigation bar and logo, and a layout of content across web pages.
- Focus on the homepage and at least two other pages.
- Reflect any feedback you received from your peers during the lab.

You can create your wireframes manually on paper, using draw.io or with AI tools ([Uizard](#), [Figma with AI plugins](#)).

5. Accessibility

In your answer document, explain how your product website will be made accessible from the start. Your plan should include:

- Specific features you will implement to support users with visual, hearing, motor and cognitive impairments.
 - Making sure everything is visible in high contrast mode

- Implementing subtitles and captions
 - Everything is doable using only a keyboard with large buttons to use
 - Descriptive alt text on all images
 - Clear language
 - Easy Navigation
- **Tools you will use to audit your site for accessibility.**
